Climate Obstruction Kristoffer Ekberg, Bernhard Forchtner, Martin Hultman, Kirsti M. Jylhä, 2022-12-30. In *Climate Obstruction: How Denial, Delay, and Inaction are Heating the Planet*, Kristoffer Ekberg, Bernhard Forchtner, Martin Hultman, and Kirsti Jylhä bring together crucial insights from environmental history, sociology, media, and communication studies, and psychology to help us understand why we are failing to take necessary measures to avert the unfolding climate crisis. They do so by examining the variety of ways in which meaningful climate action has been obstructed. This ranges from denial of the scientific evidence for human-induced climate change and its policy consequences to seemingly sincere acknowledgement of scientific evidence while nevertheless delaying meaningful climate action. The authors also consider all those actions by which, often well-meaning individuals and collectives, unintentionally hamper climate action. In doing so, this book maps out arguments and strategies that have been used to counter environmental protection and regulation since the 1960s by first and foremost corporations supported by conservative actors but also far-right ones as well as ordinary citizens. This timely and accessible book provides tools and lessons to understand, identify, and call out such arguments and strategies and points to actions and systemic and cultural changes needed to avert or at least mitigate the climate crisis.

Air Pollution Calculations Daniel A. Vallero, 2023-09-17. *Air Pollution Calculations: Quantifying Pollutant Formation, Transport, Transformation, Fate, and Risks*, Second Edition, enhances the systems science aspects of air pollution, including transformation reactions in soil, water, sediment, and biota that contribute to air pollution. This second edition will be an update based on research and actions taken since 2019 that affect air pollution calculations, including new control technologies, emissions measurement, and air quality modeling. Recent court cases, regulatory decisions, and advances in technology are discussed, and where necessary, calculations have been revised to reflect these updates. Sections discuss pollutant characterization, pollutant transformation, and environmental partitioning. Air partitioning, physical transport of air pollutants, air pollution biogeochemistry, and thermal reactions are also thoroughly explored. The author then carefully examines air pollution risk calculations, control technologies, and dispersion models. The text wraps with discussions of economics and project management, reliability and failure, and air pollution decision making. Provides real-life current cases as examples of quantitation of emerging air pollution problems. Includes straightforward derivation of equations giving practitioners and instructors a direct link between first principles of science and applications of technologies. Presents example calculations that make scientific theory real for the student and practitioner.
