Environmental Cleanup at Navy Facilities National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Committee on Environmental Remediation at Naval Facilities, 2003-07-16 The number of hazardous waste sites across the United States has grown to approximately 217 000 with billions of cubic yards of soil sediment and groundwater plumes requiring remediation Sites contaminated with recalcitrant contaminants or with complex hydrogeological features have proved to be a significant challenge to cleanup on every level technologically financially legally and sociopolitically Like many federal agencies the Navy is a responsible party with a large liability in hazardous waste sites Environmental Cleanup at Navy Facilities applies the concepts of adaptive management to complex high risk hazardous waste sites that are typical of the military EPA and other responsible parties The report suggests ways to make forward progress at sites with recalcitrant contamination that have stalled prior to meeting cleanup goals This encompasses more rigorous data collection and analysis consideration of alternative treatment technologies and comprehensive long term stewardship

Processes, Assessment and Remediation of Contaminated Sediments Danny D. Reible, 2013-07-20 The purpose of this book is to help engineers and scientists better understand contaminated sediment sites and identify and design remedial approaches that are more efficient and effective Contaminated sediment management is a difficult and costly exercise that is rarely addressed with easily identified and implemented remedies It is hoped that this book can help identify and implement management approaches that provide an optimal if not entirely satisfactory solution to sediment contaminant problems

Chlorinated Solvent Source Zone Remediation Bernard H. Kueper, Hans F. Stroo, Catherine M. Vogel, C. Herb Ward, 2014-04-22 The purpose of this book is to help engineers and scientists better understand dense nonaqueous phase liquid DNAPL contamination of groundwater and the methods and technology used for characterization and remediation Remediation of DNAPL source zones is very difficult and controversial and must be based

on state of the art knowledge of the behavior transport and fate of nonaqueous phase liquids in the subsurface and site specific geology chemistry and hydrology This volume is focused on the characterization and remediation of nonaqueous phase chlorinated solvents and it is hoped that mid level engineers and scientists will find this book helpful in understanding the current state of practice of DNAPL source zone management and remediation Alternatives for Managing the Nation's Complex Contaminated Groundwater Sites National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Committee on Future Options for Management in the Nation's Subsurface Remediation Effort, 2013-03-27 Across the United States thousands of hazardous waste sites are contaminated with chemicals that prevent the underlying groundwater from meeting drinking water standards These include Superfund sites and other facilities that handle and dispose of hazardous waste active and inactive dry cleaners and leaking underground storage tanks many are at federal facilities such as military installations While many sites have been closed over the past 30 years through cleanup programs run by the U S Department of Defense the U S EPA and other state and federal agencies the remaining caseload is much more difficult to address because the nature of the contamination and subsurface conditions make it difficult to achieve drinking water standards in the affected groundwater Alternatives for Managing the Nation's Complex Contaminated Groundwater Sites estimates that at least 126 000 sites across the U S still have contaminated groundwater and their closure is expected to cost at least 110 billion to 127 billion About 10 percent of these sites are considered complex meaning restoration is unlikely to be achieved in the next 50 to 100 years due to technological limitations At sites where contaminant concentrations have plateaued at levels above cleanup goals despite active efforts the report recommends evaluating whether the sites should transition to long term management where risks would be monitored and harmful exposures prevented but at reduced costs New York University Environmental Law Journal ,2005 *Technical Reports Series* ,2006 **Management of Long Term Radiological Liabilities** International Atomic Energy Agency, 2006 Experience in IAEA member states has often shown that sites with radiation legacies cannot be remediated to residual levels of radioactivity below concern and so cannot be released for unrestricted use Residual contamination buried wastes and other hazards may remain after cleanup is complete for several reasons including technical limitations economic feasibility worker health and safety issues This publication deals with the key conceptual managerial and technical issues involved in the maintenance of institutional control over sites for prolonged periods of time possibly for hundreds or even thousands of years The management of sites with such long term radiological liabilities is often referred to as stewardship **Environmental Cleanup at Navy Facilities** Committee on Environmental Remediation at Naval Facilities, Commission on Geosciences, Environment and Resources, Division on Earth and Life Studies, National Research Council, 1999-04-01 The fiscal and technological limitations associated with cleaning up hazardous waste sites to background conditions have prompted responsible parties to turn to risk based methods for environmental remediation Environmental Cleanup at Navy Facilities

reviews and critiques risk based methods including those developed by the U S Environmental Protection Agency and the American Society of Testing and Materials These critiques lead to the identification of eleven criteria that must be part of any risk based methodology adopted by the Navy a responsible party with a large number of complex and heavily contaminated waste sites January Contaminants in the Subsurface ,2005-04-06 At hundreds of thousands of commercial industrial and military sites across the country subsurface materials including groundwater are contaminated with chemical waste The last decade has seen growing interest in using aggressive source remediation technologies to remove contaminants from the subsurface but there is limited understanding of 1 the effectiveness of these technologies and 2 the overall effect of mass removal on groundwater quality This report reviews the suite of technologies available for source remediation and their ability to reach a variety of cleanup goals from meeting regulatory standards for groundwater to reducing costs The report proposes elements of a protocol for accomplishing source remediation that should enable project managers to decide whether and how to pursue source remediation at their sites
